Thermoelectric Wood Stoves

Thursday, September 21, 2017
10:00 AM ET

In support of the Alliance for Green Heat's 4th Wood Stove Competition in November 2018

NEXT GENERATION
Woodstove
DesignChallenge

ALLIANCE FOR GREEN HEAT
low carbon, renewable and local

BTEC
Biomass Thermal Energy Council

Quick Notes

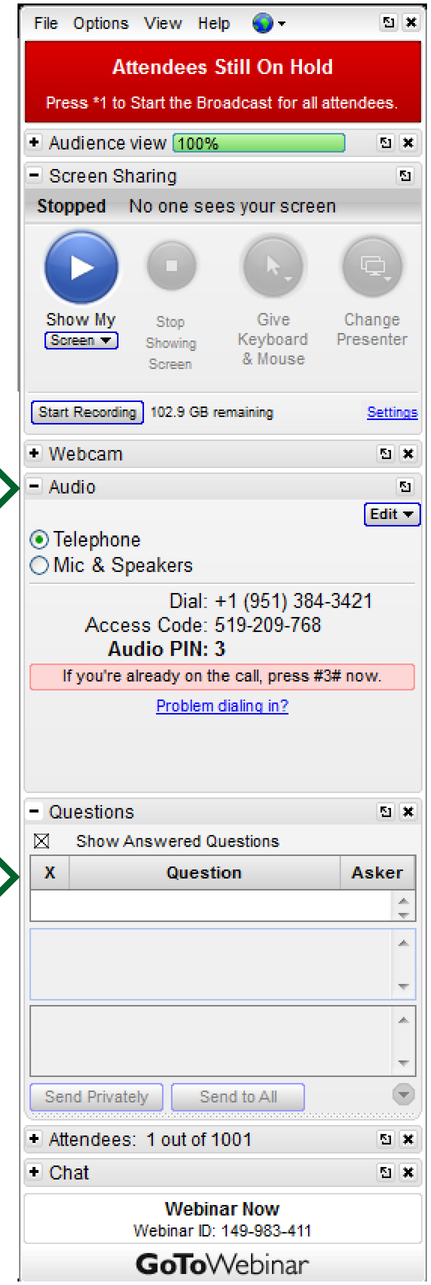
- Two Audio Options: Streaming Audio and Dial-In.
  1. Streaming Audio/Computer Speakers (Default)
  2. Dial-In: Use the **Audio Panel** (right side of screen) to see dial-in instructions.
  - Call-in separately from your telephone.

- Ask questions using the **Questions Panel** on the right side of your screen.

- The recording of the webinar and the slides will be available after the event. Registrants will be notified by email.

Audio

Questions



ALLIANCE FOR GREEN HEAT

low carbon, renewable and local

- ✓ 501c3 nonprofit
- ✓ Promotes clean & efficient biomass heaters
- ✓ National voice for wood heat consumers
- ✓ Hosts design competitions
- ✓ Encourages transparency from manufacturers and regulators

NEXT GENERATION WoodStove DesignChallenge

- 4th Wood Stove Design Challenge
  - November 9-14, 2018
  - National Mall in Washington DC
- Two Competition Categories:
  - Automated stoves
  - Thermoelectric stoves

Thank you!

John Ackerly – jackerly@forgreenheat.org

Ken Adler – kadler@forgreenheat.org

BTEC
Biomass Thermal Energy Council

About BTEC

The national trade association for the modern wood heating industry.

- Engage in technical codes and standards development, public advocacy, and education.

- **100+ members and associates across the US and Canada:**
- Fuel Producers
- Manufacturers
- Sellers
- Installers
- Service Providers
- Universities
- Non-profits & NGOs
- Government agencies

Bear Mountain Forest Products SINCE 1988

alphabet energy

we make waste heat valuable

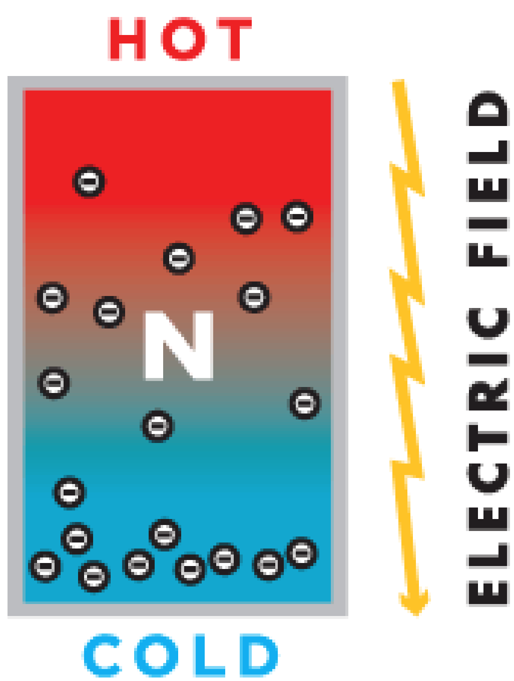
Adam Lorimer, Co-Founder
September 2017 adam@lorimer-intl.com

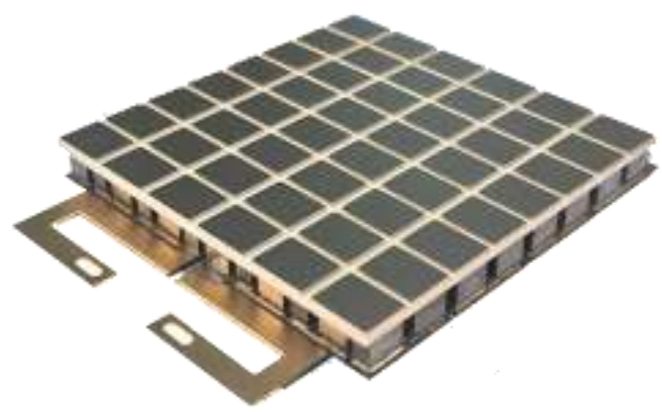
Agenda

- What is a Thermoelectric?
- What can you do with it?
- How do you do it?

What is a Thermoelectric?

Materials that directly turn heat into electricity with no moving parts





alphabet energy

Using materials which change heat directly into electricity, this thermoelectric teakettle powers radio

Today's Alchemist is Opening a New World

ELECTRICITY DIRECT FROM HEAT

IN THE WESTINGHOUSE Research Laboratories at Pittsburgh I saw an old-fashioned copper teakettle bubbling away over a gas burner while waltz music came from a radio beside it. A homey scene, but deceptive, for unless hundreds of scientists and engineers throughout the world turn out to be wrong, it was a symbol of future power as exciting in its implications as another kettle which stirred the imagination of a boy named James Watt two centuries ago. A cable running from the kettle to the radio furnished its electric power—power produced by the same flame that boiled the water. In the base of the kettle was a small pioneer "thermoelectric generator" which converts heat directly into electric current, with no intermediate machinery.

Watt's teakettle grew up to be a steam boiler, and most of today's electric power

The Alphabet Energy E1™

Heat Recovery for MW Diesel & Nat Gas Engines in Remote Service

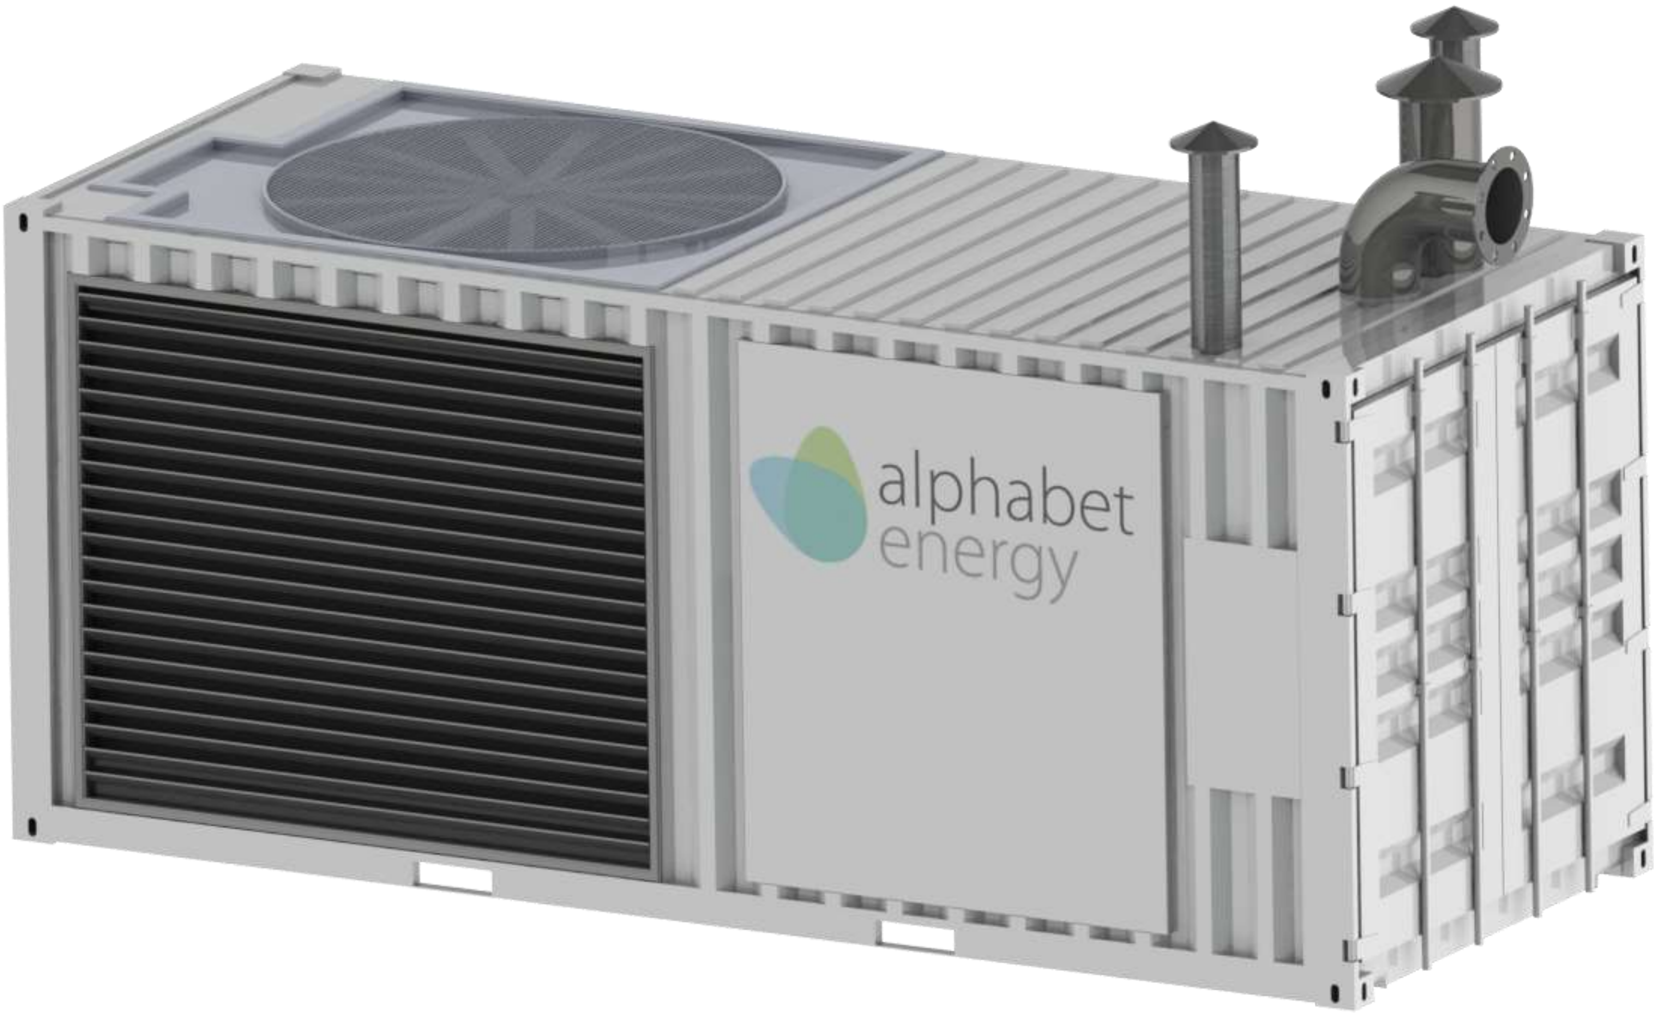
15 kW demonstrated output in the field – most powerful thermoelectric generator ever built

alphabet energy

The Alphabet Energy E1™ Thermoelectric Generator

The Alphabet Energy E1™ in the Eagle Ford, Texas

E1 Gen III – 25kW in development

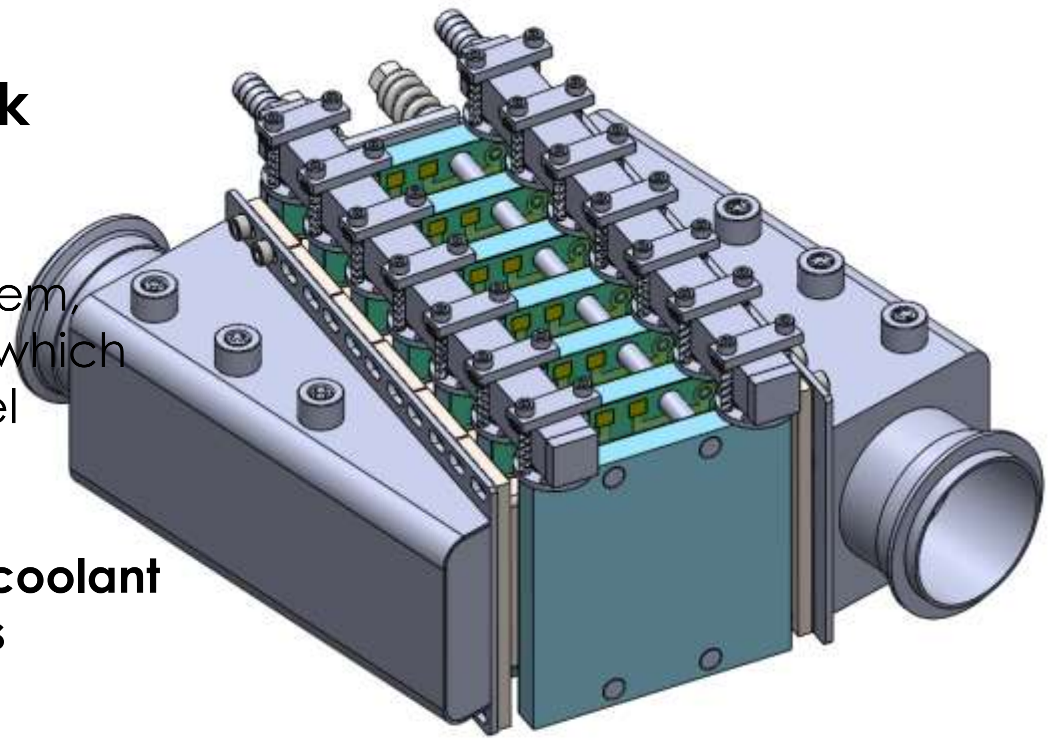


1st Commercial Thermoelectric Product > 1kW The Power Generating Combustor - PGC

- **2.5kW Net Power (5kW Gross)**
- **Quad-O combustion efficiency**
- **Power for instruments, communications, cathodic protection, etc**
- **Powers air compressor to eliminate gas hydraulics**
- **Permitted as a generator not a flare.**

Automotive PowerModule

350W Peak power on a 5.3L truck
155W Average City & Highway.



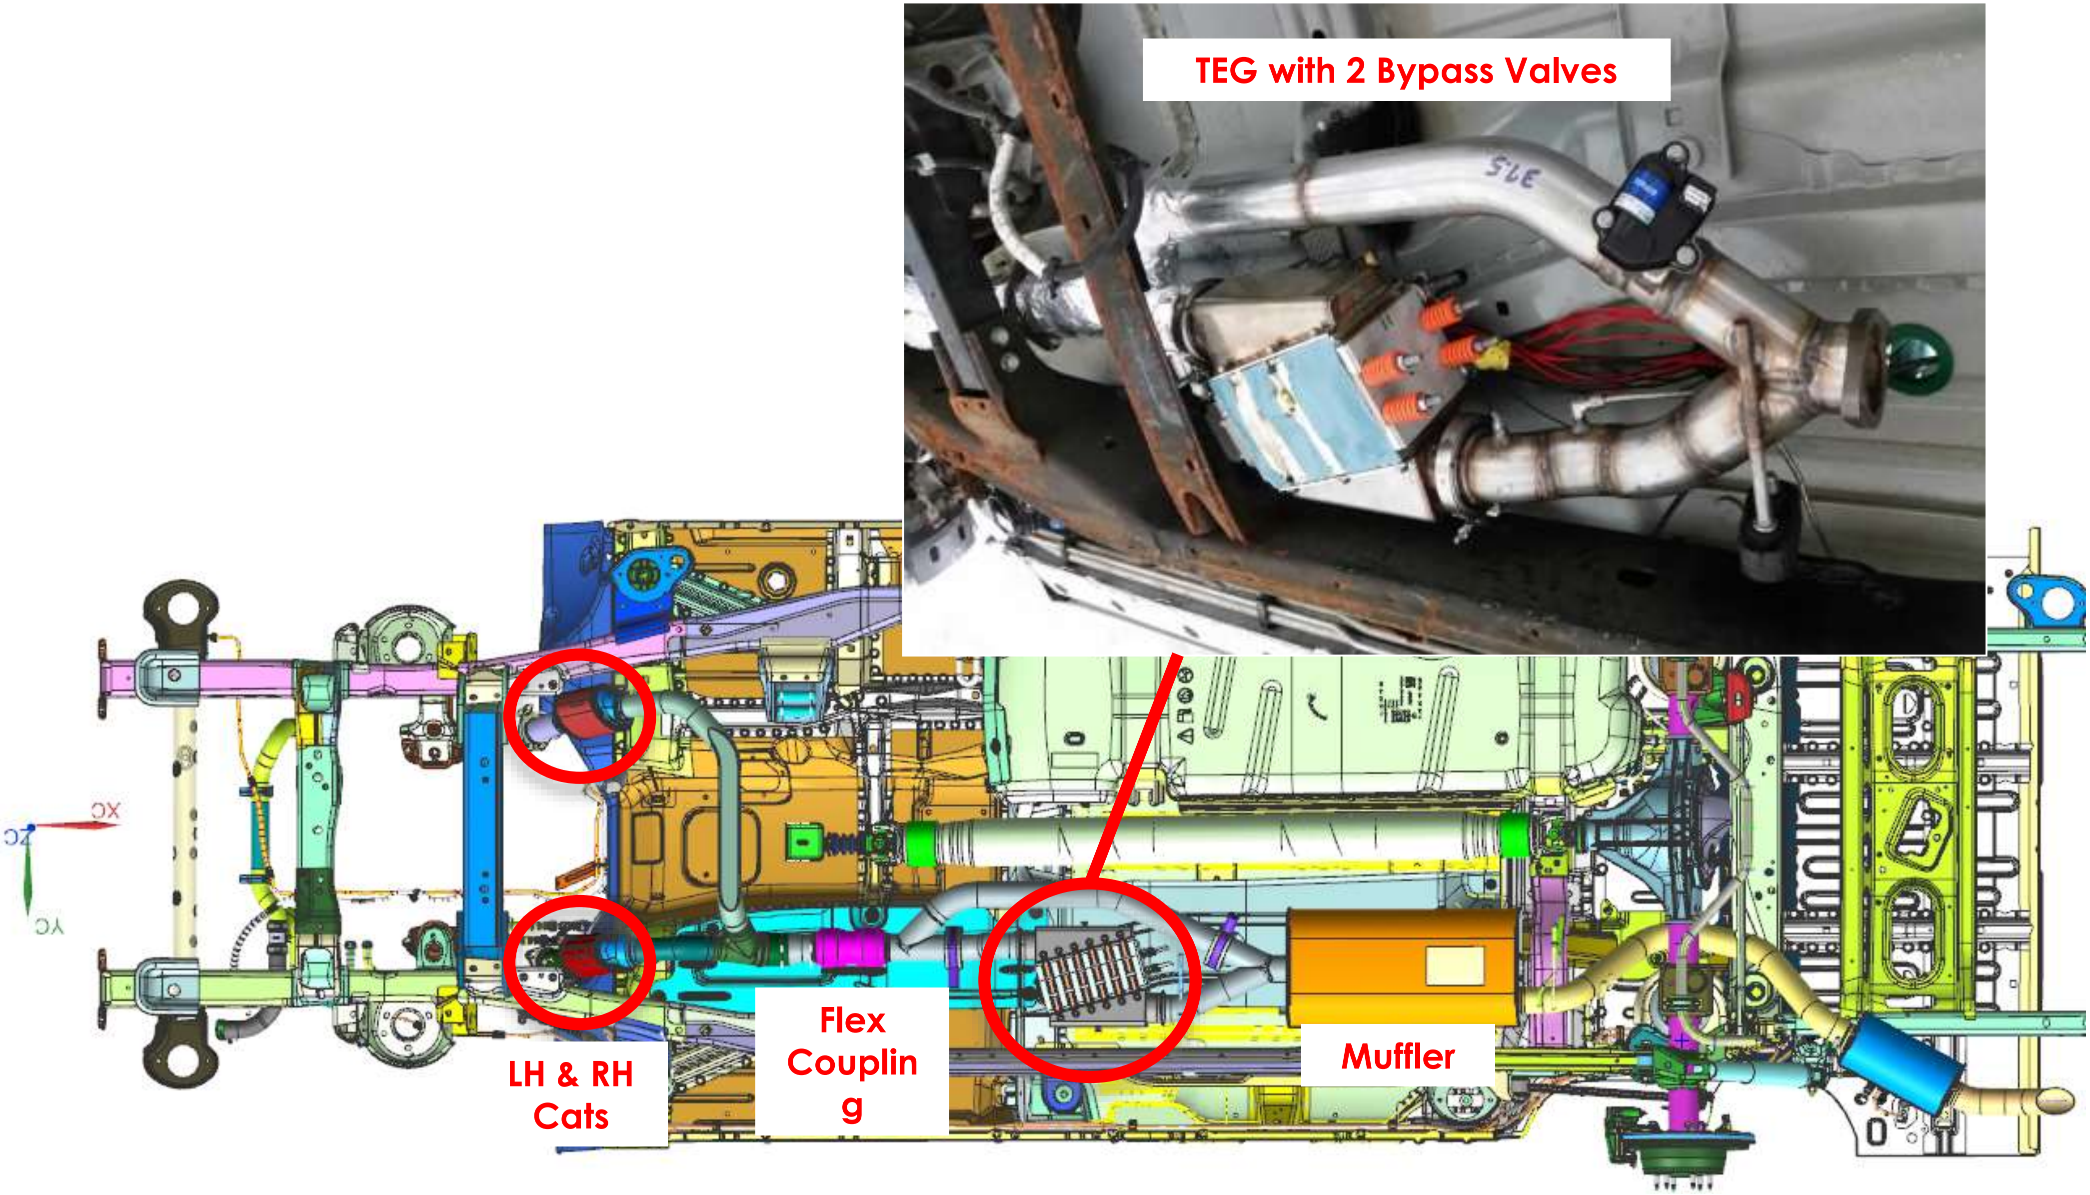
The PowerModule fits in the exhaust system, extracting heat and generating power which unloads the alternator and improves fuel economy.

Transferring exhaust heat to the engine coolant accelerates warm-up and further boosts efficiency

3% fuel economy improvement,
A key technology in satisfying 2025 CAFE standards

alphabet energy

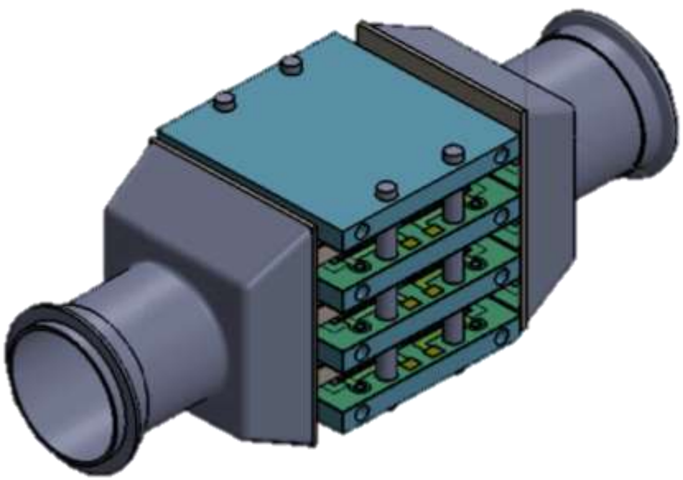
Vehicle Integration Test 5.3L Suburban

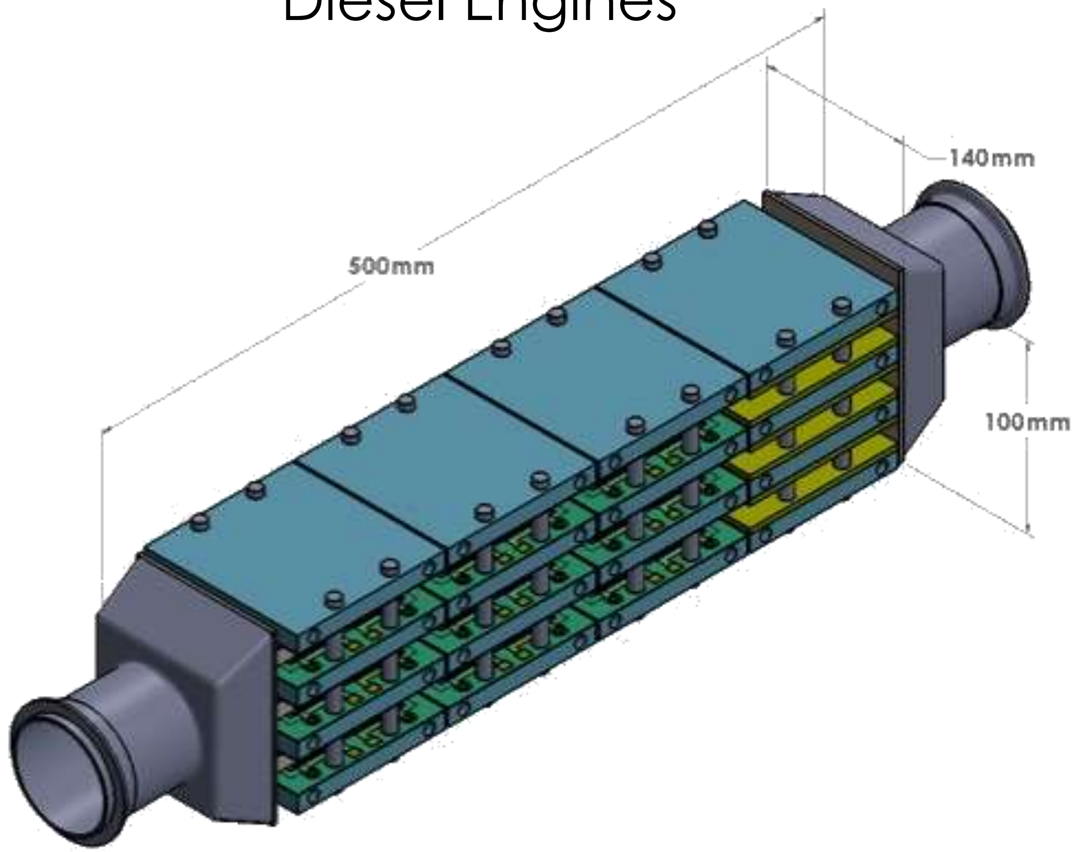


Scalable Automotive Architecture

- Units for smaller engines

- Exhaust Gas Recirculation Cooler on Diesel Engines





Practical Thermoelectric Design Issues

1. Thermoelectric Material Selection

2. Thermal Interfaces

3. Thermal Resistance Matching

4. Power Conditioning

alphabet energy

Material Selection

Lead Telluride | **Half Heusler** | **Skutterudite** | **LAST**

- High Temperature operation
- High efficiency
- Expensive Raw Materials - commercial dead-end for large volume applications.
- Require Vacuum.
- Not commercially available

Tetrahedrite / MgSi

- AE Material
- Medium-high temperature operation
- High efficiency
- Abundant raw materials - Low cost at scale.
- Operates in air
- Production all committed.

Bismuth Telluride

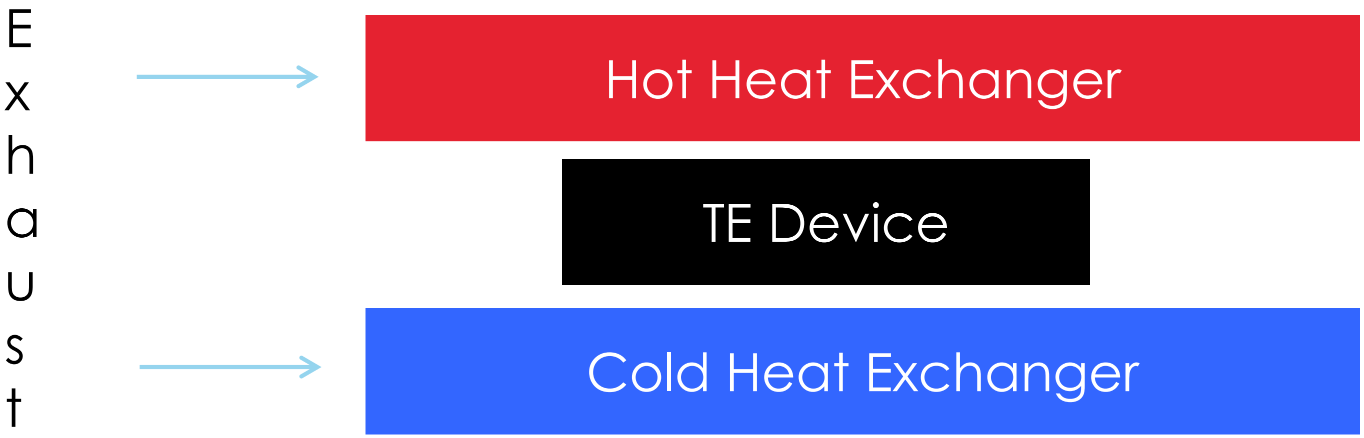
- Low-Medium temperature operation
- Lower power than others
- Operates in air
- Commercially available
- Your only real option.

Marlow - highest power, reliability & cost.
Alternatives: **Tellurex, Ferrotec, Thermonamics**

Performance may vary – datasheets rarely accurate

250C max operating condition, some suppliers quote 300C but this is usually due to poor thermal contact and won't yield benefits.

Putting it together



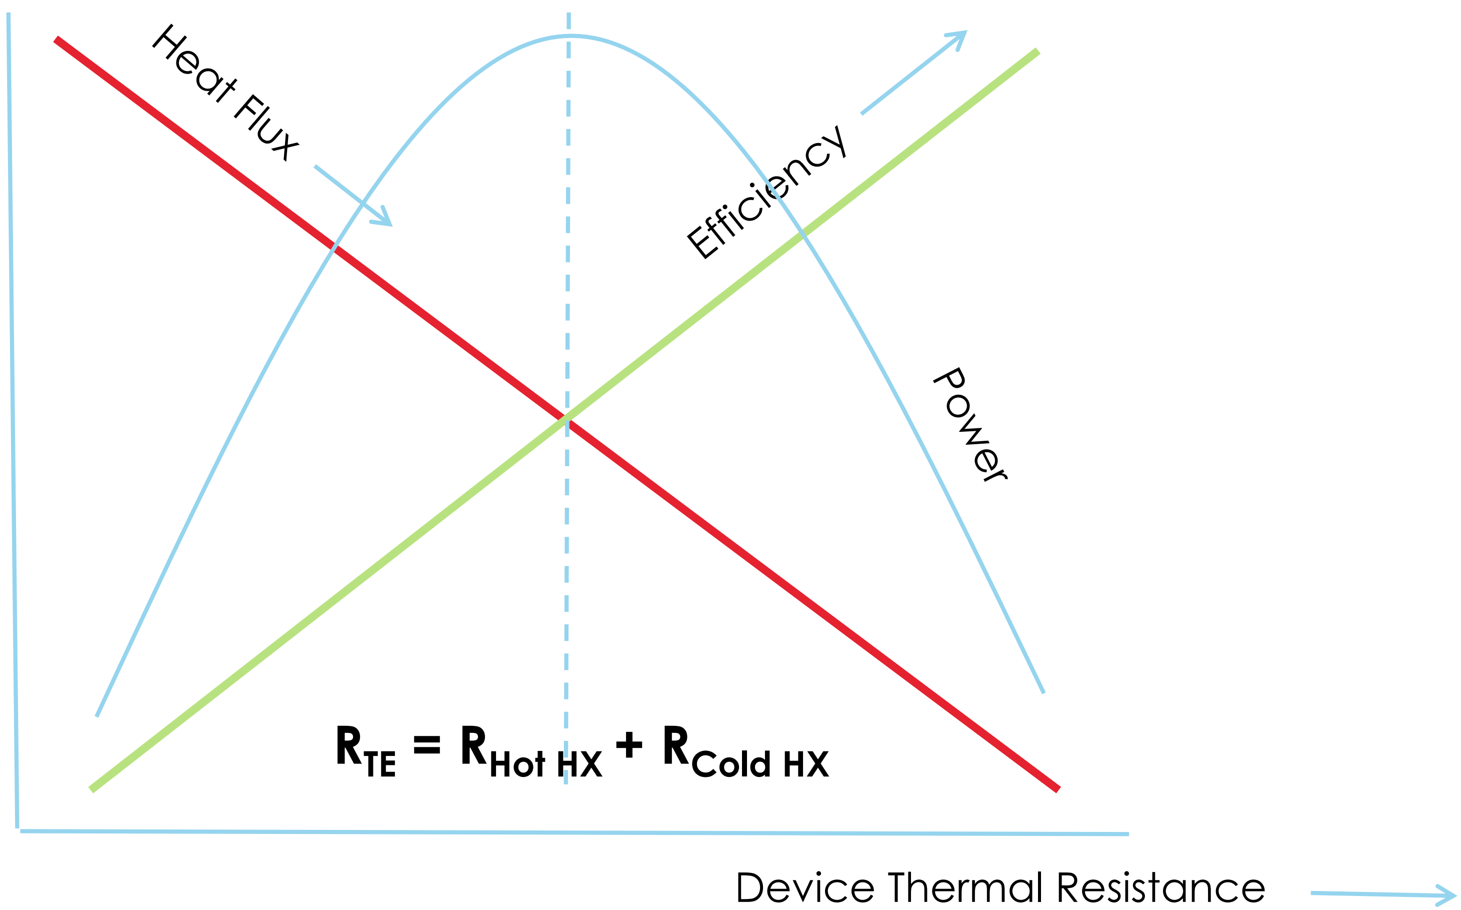
- Getting good thermal contact between heat exchanger and TE device while minimizing thermal stress is essential

- Thermal Interface Materials
  - Graphite – up to ~400C, not dielectric, a lot of pressure
  - Thermal Grease – 200C ish, dry out & pump out
  - Silicone Gap Pad – 200C ish, bubbles

- Careful of thermal bypass losses

Thermal Resistance Matching

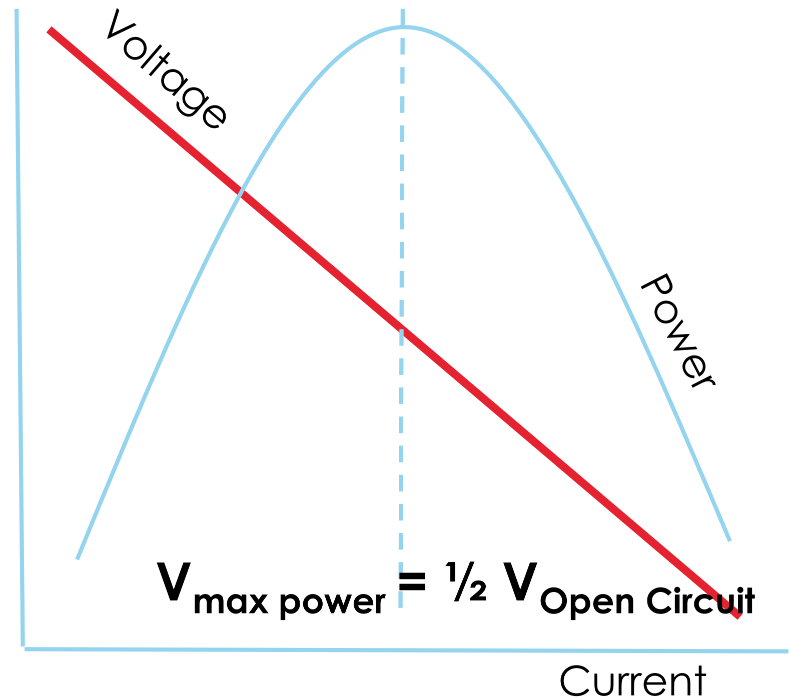
Efficiency a Device Temperature Gradient



This means half your temperature drop is across the TE (unless limited by operating temp)

Power Conditioning

- Power Output is DC
- Requires Max Power Point Tracking
- Voltage & Current will vary with temperature and flow
- May not be the voltage you want.



- For DC-AC Power Solar Inverters work with Thermoelectrics
  - Be careful of dielectric strength
- For DC-DC Linear Technologies make a demo-board

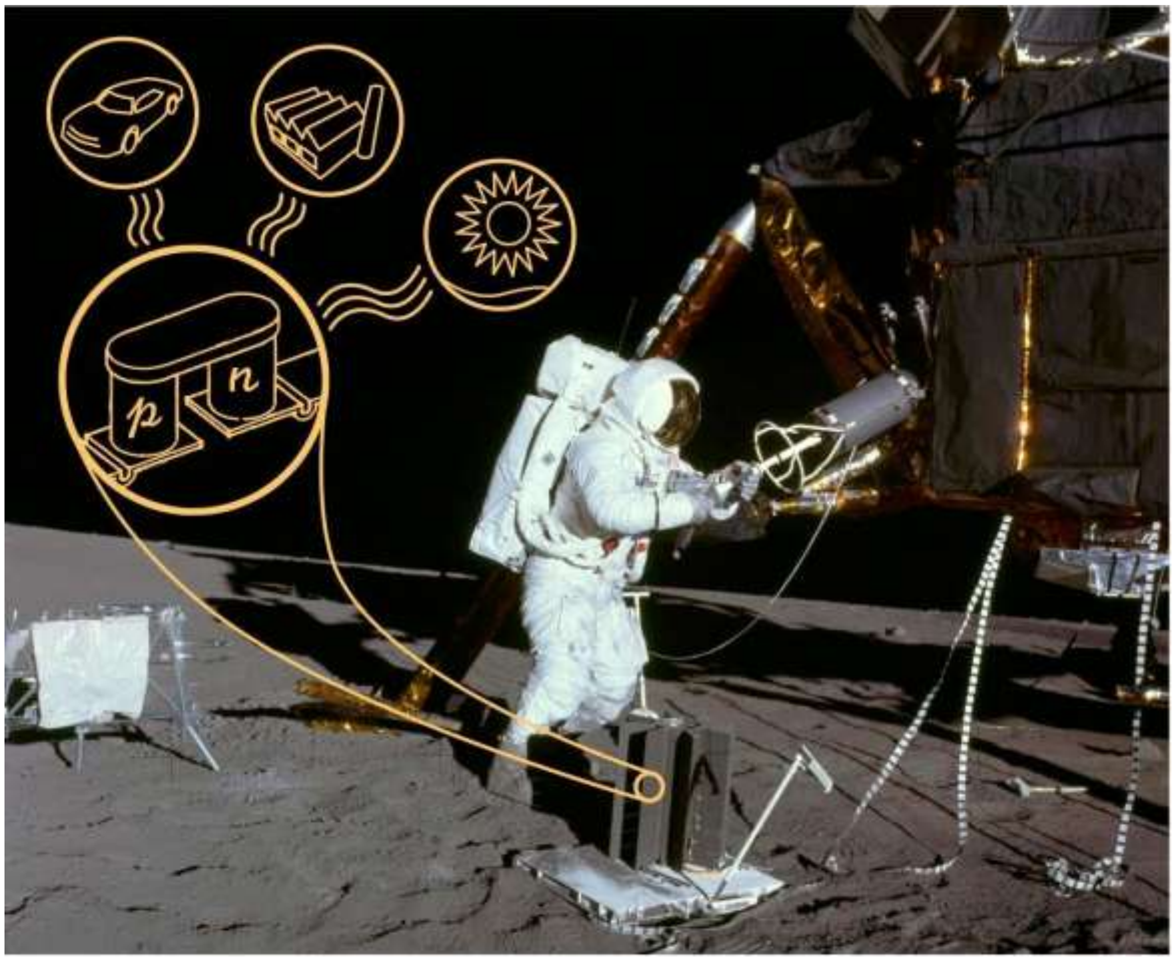
Design and Engineering of Thermoelectric Devices

G. Jeffrey Snyder, Northwestern University

http://thermoelectrics.matsci.northwestern.edu



Thermoelectric Device

Thermoelectrics

Convert Heat into Electricity

Heat Flow drives free electrons and holes from hot to cold

Voltage Produced

Seebeck effect

or Thermoelectric Power

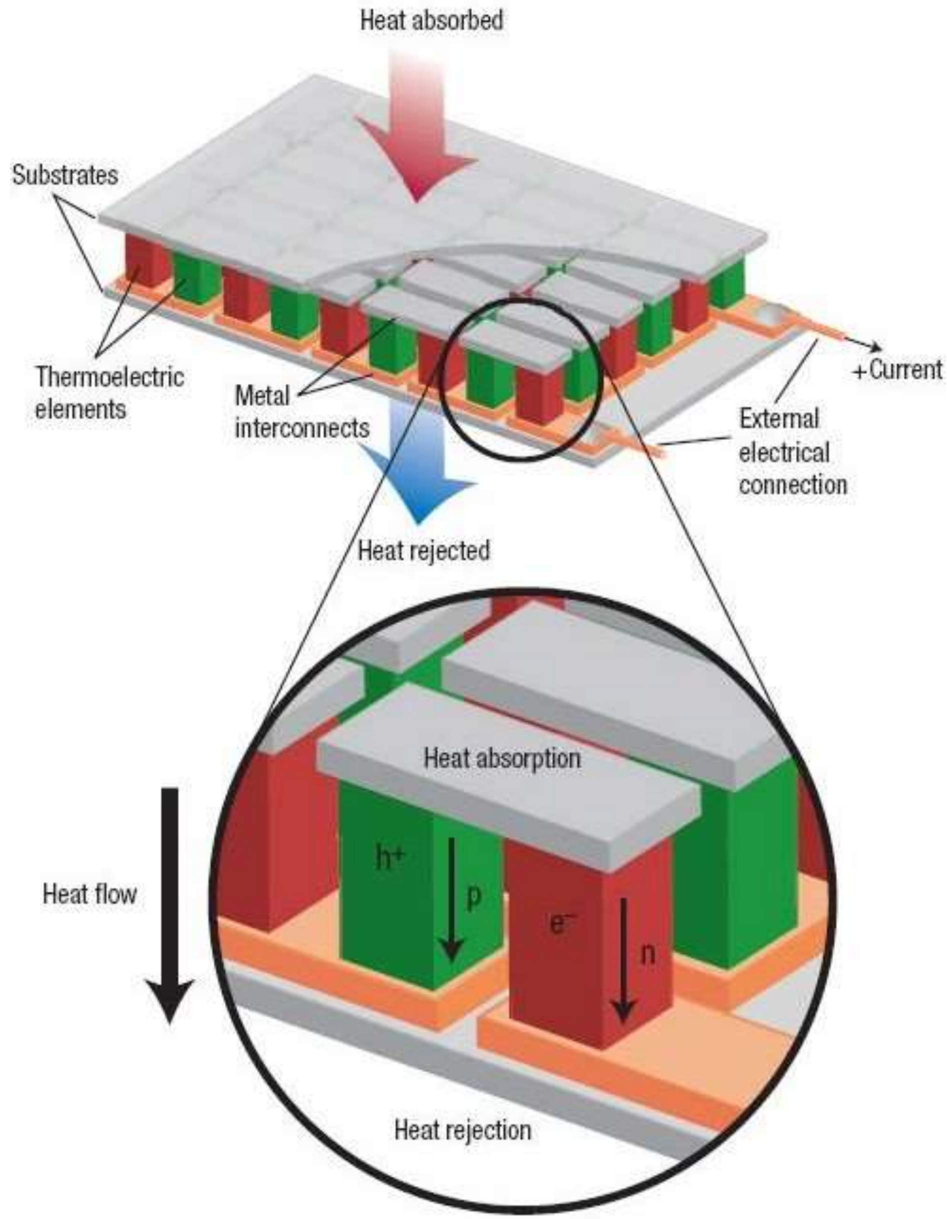
$$V = S \otimes T$$

Seebeck Coefficient α

Efficiency $\sim zT$

$$zT = \frac{S^2}{\rho\kappa} T$$

Typically $zT < 1$



Snyder, Toberer *Nature Materials* **7,** 105 (2008)

Thermoelectrics
Northwestern Materials Science and Engineering

Thermoelectric Applications

Solid State Advantage
- No moving parts
- No maintenance
- Long life
- Scalability

Cooling - Thermal Management
- Small Refrigerators
- Optoelectronics
- Electric Vehicles
  - Zonal HVAC

Power Generation (heat to electricity)
- Spacecrafts
  - Voyager over 40 years!
- Remote power sources

Energy Harvesting
- Remote Sensor Power

2012 Mars Rover *Curiosity*

Gentherm Zonal HVAC

Thermoelectrics
Northwestern Materials Science and Engineering

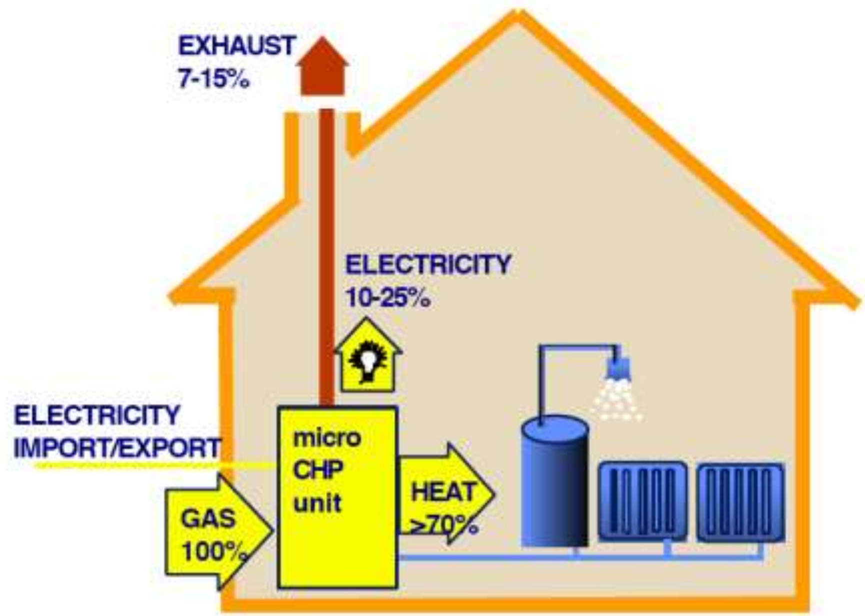
Co-Generation

Combined Heat and Power

- Burn Fuel to produce Heat
- Convert Heat to Electricity
- Utilize waste Heat for heating

Common for institutional power plan

- Universities
- Factories
- Where efficiency is valuable
  - 10% of Europe electricity is cogen



Could be used anywhere high exergy content fuel is used for heating

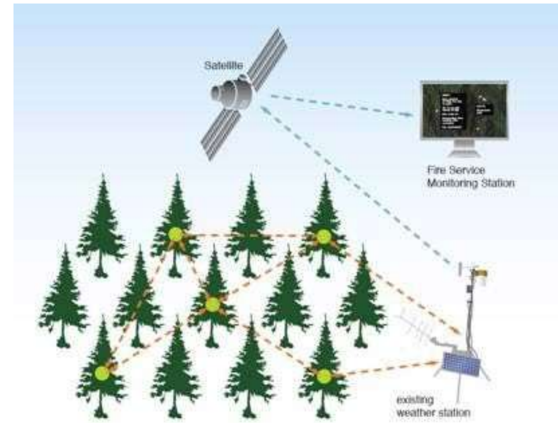
- ~90% efficiency in Electricity Generation
- Capital, Maintenance cost is primary issue

Thermoelectrics
Northwestern Materials Science and Engineering

Thermoelectric Energy Harvesting

Situations where replacing a Battery is insufficient

- Li-ion ~ 1kJ/cm^3
- 10% charge loss/month ~ 40µW/cm^3
- one day recharge ~ 10 mW/cm^3



Examples

- Remote Sensors, communications
  - Low average power consumption
- Wearable electronics

Ambient Energy source available

- Light (PhotoVoltaic)
- Vibration
- Heat (ThermoElectric)

Thermoelectrics
Northwestern Materials Science and Engineering

Thermoelectric Stove

Waste heat – Cogeneration example

Thermoelectric powered fan improves combustion

- 95% less smoke (CO), pollution
- 50% less fuel
- recharges cell phone, LED lights.

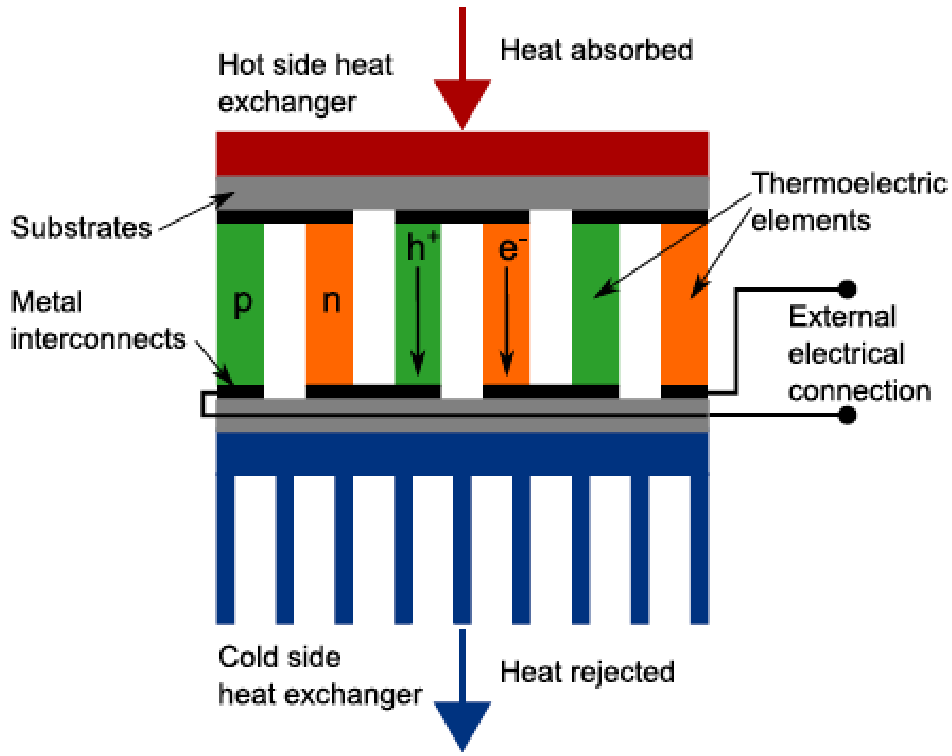
Conceptual Design of Thermoelectric Generators



Energy Laws

1st law of thermodynamics

Energy is Conserved

2nd law of thermodynamics

Entropy ≥ 0

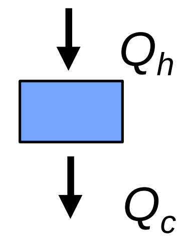
Example 1: Heat Conduction

$Q_h = Q_c$ *(1st law)*

$T_h > T_c$ *(2nd law)*

Heat flows from Hot to Cold

(Unless there is work being done to system)



Example 2: Heat Engine

$Q_h = Q_c + W$ *(1st law)*

Efficiency $\eta = W/Q_h$

$\eta \leq \Delta T/T_h$ *(Carnot Efficiency)*

Efficiency always less than Carnot

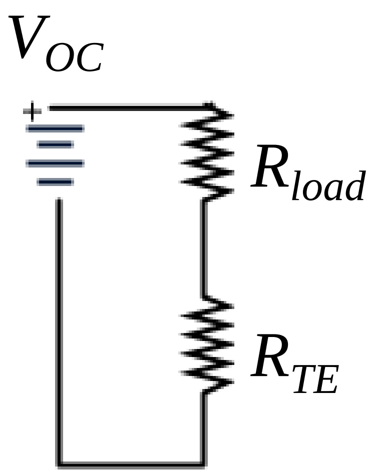
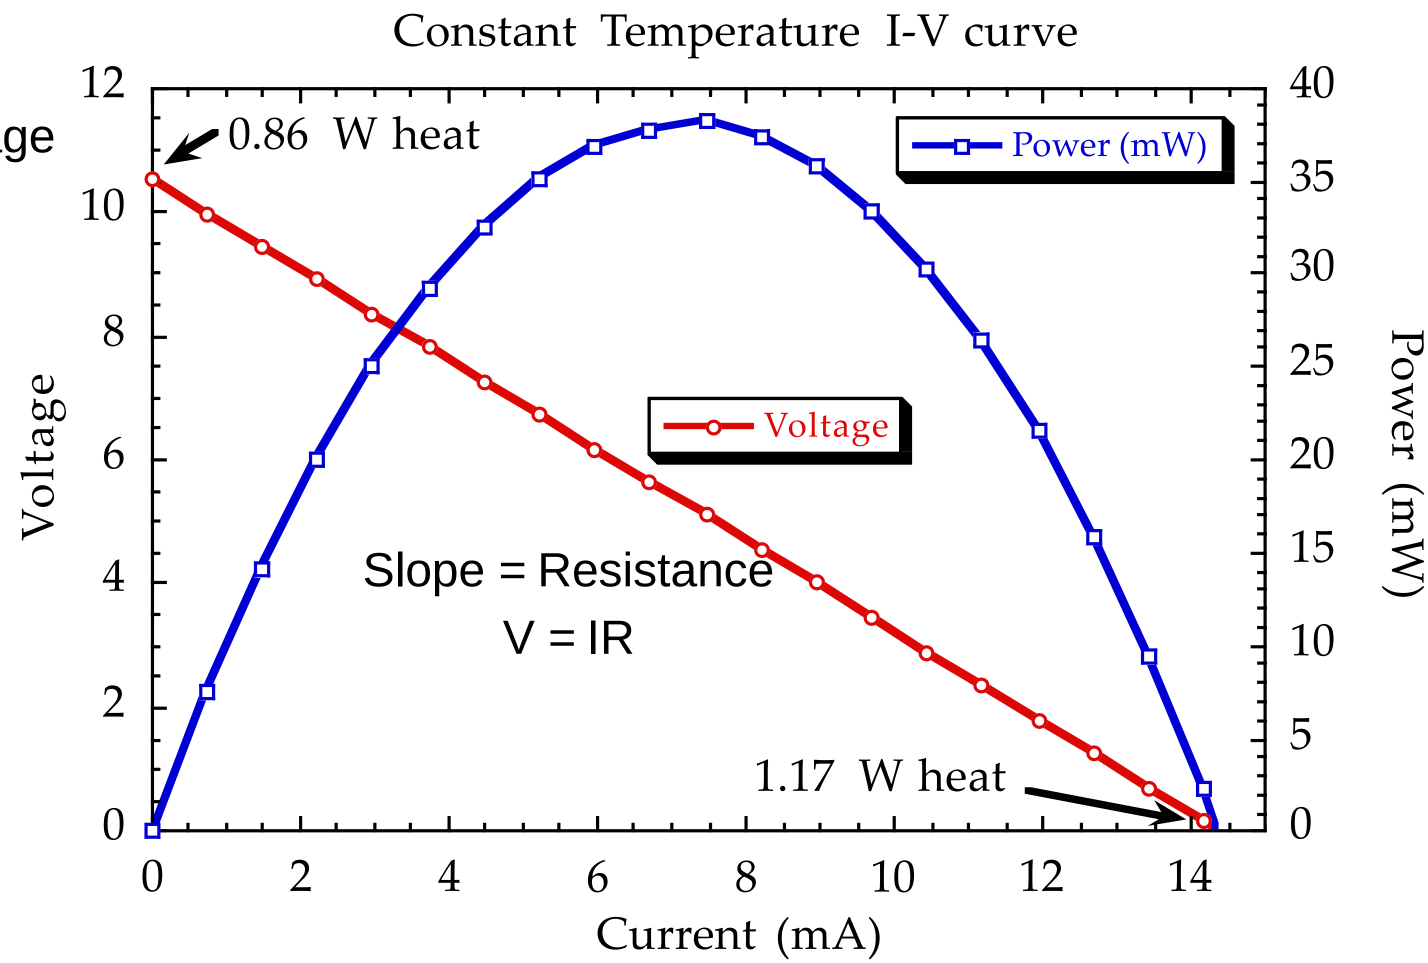
Vining, *Nature Materials* ***8*****,** 83 (2009)

TE Module Electrical Output

Open Circuit Voltage

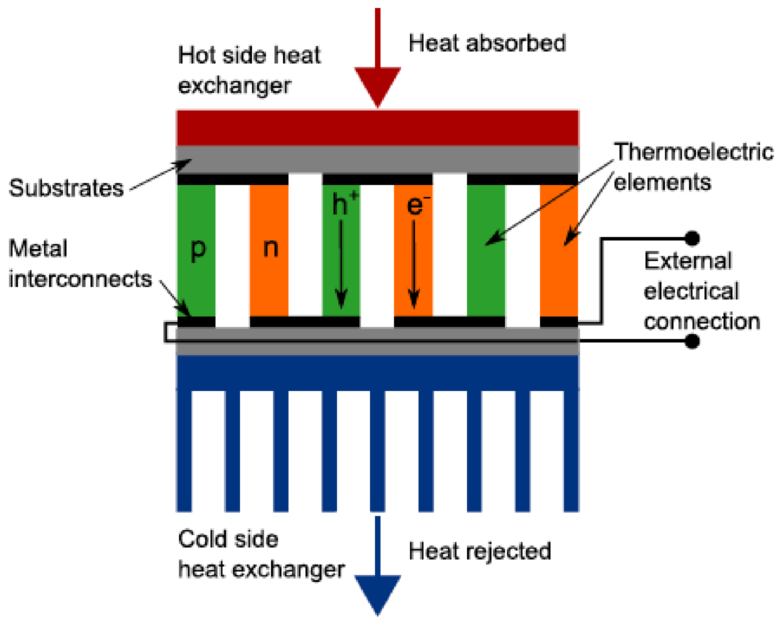
$V_{OC} = S\Delta T$



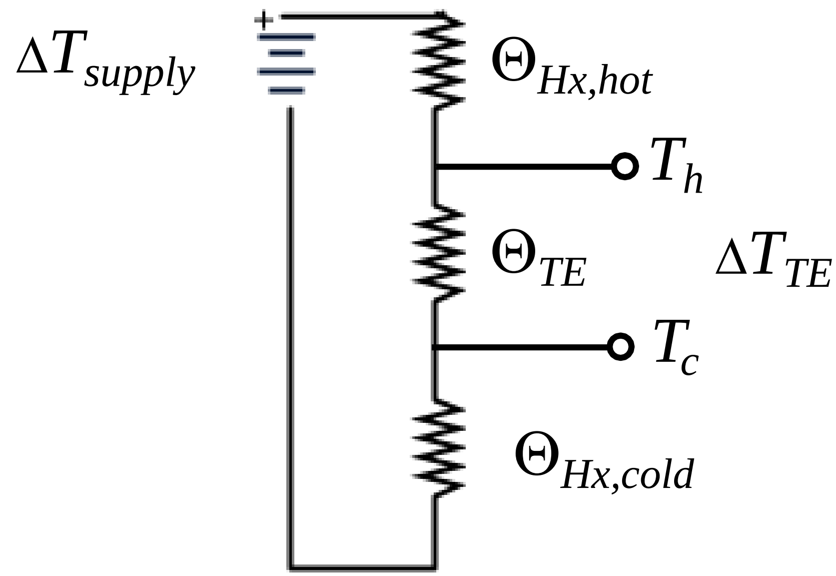


Effective Thermal Model

Thermal model



Thermal Circuit



Baranowski, Snyder et al, *J Applied Phys.* 113, 204904, (2013)

Maximizing Power

Thermal Impedance Match

maximum power when

$$\Theta_{TE} = \Theta_{\mathrm{Hx}}$$

so Heat exchangers determine heat flux

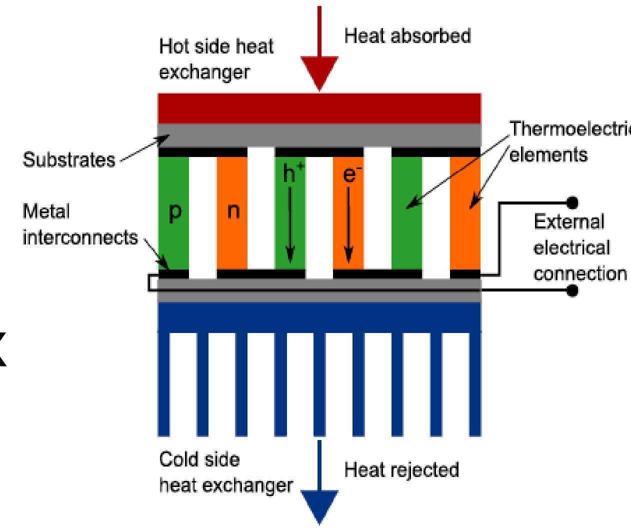
$$\dot{Q} = \frac{\Delta T_{\mathrm{supply}}}{\Theta_{\mathrm{Hx}} + \Theta_{TE}}$$

Efficiency determines power

$$P = \eta \dot{Q}$$

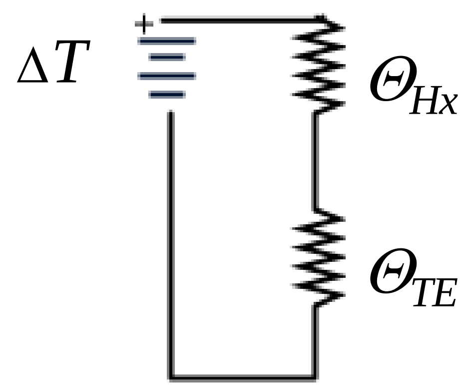
ZT determines efficiency

$$P_{\max} = \frac{\Delta T^2}{4T_h \Theta_{Hx}} \frac{\sqrt{1+ZT}-1}{\sqrt{1+ZT}+T_c/T_h}$$



Thermal circuit model

$$\Theta_{\mathrm{Hx}} = \Theta_{\mathrm{Hx,hot}} + \Theta_{\mathrm{Hx,cold}}$$



Thermoelectrics
Northwestern Materials Science and Engineering

Baranowski, Snyder et al, J Applied Phys. 113, 204904, (2013)

Device Efficiency from ZT

Device Figure of Merit ZT

$$\eta = \frac{\otimes T}{T_h}\frac{\sqrt{1+ZT}-1}{\sqrt{1+ZT}+T_c/T_h}$$

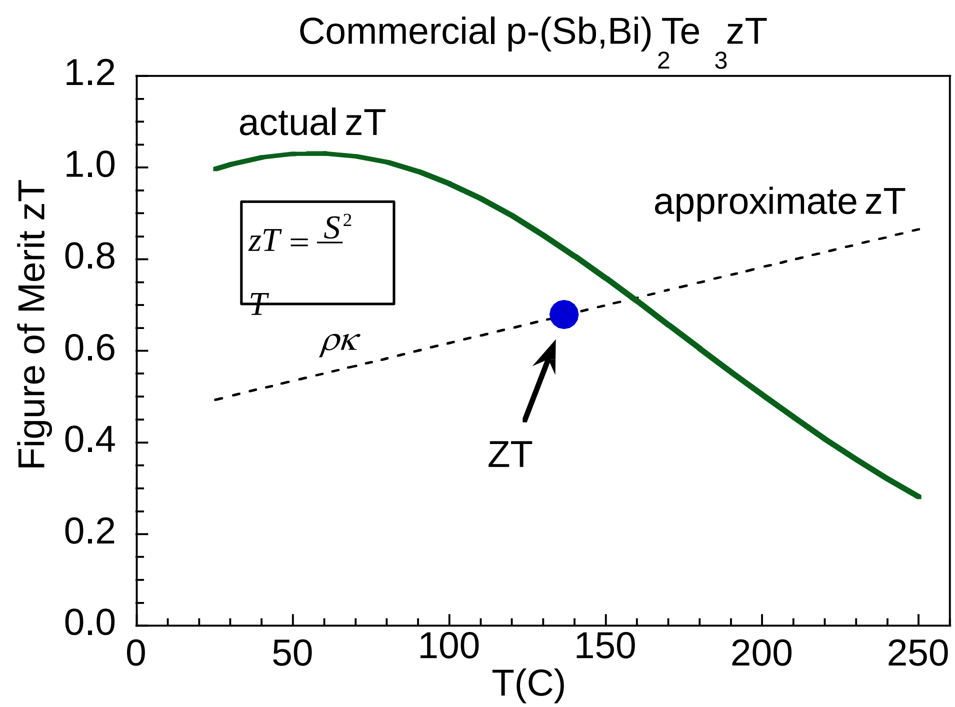
Carnot Factor *Reduced Efficiency*

Seebeck Coefficient S

Electrical Resistance R

Thermal Conductance K

$$ZT \approx \frac{S^2}{RK}\frac{T_c+T_h}{2}$$



Device ZT is approx. an average of Materials figure of merit zT over the temperature range of use

Goldsmid, H. J. Applications of Thermoelectricity (Methuen, London, 1960).

ZT or Cost?

Lowest system cost/W is usually dominated by heat exchanger cost rather than TE material cost

- even \$200/kg (Bi_2Te_3) is OK

Power increases with ZT so cost directly depends on ZT but not TE cost

$$\frac{Cost}{W} \approx \left(\frac{Cost}{Area}\right)_{HX} \cdot \frac{1}{ZT}$$

ZT is TE cost metric

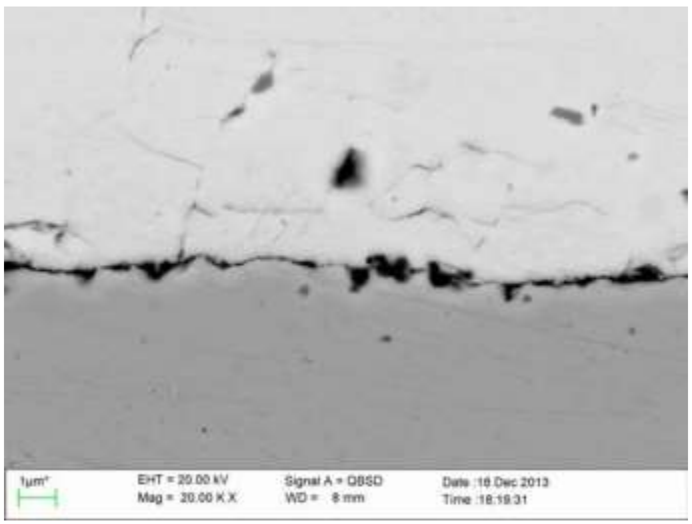
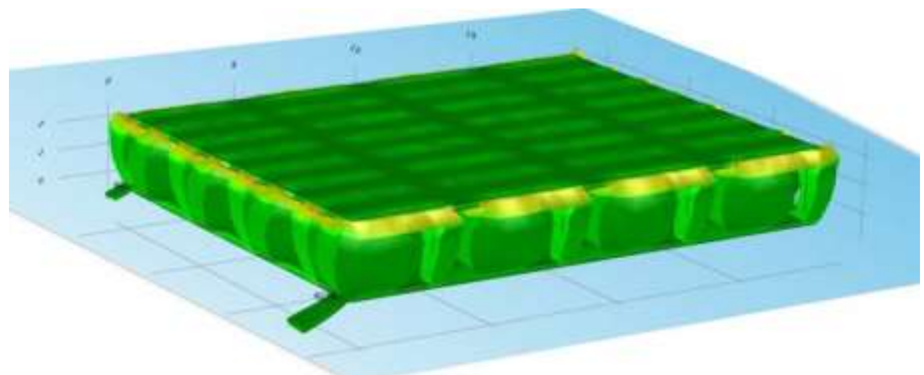
Module Failure Example

Reason for failure: Solder reacted with PbTe at elevated temperatures – crack formation at interface.



Crack at Metal − TE Interface



Stress Model: stress concentration at hot junction

Thermoelectrics
Northwestern Materials Science and Engineering

ITRI Taiwan

Wood Stove Challenges

Performance goal

3W commercialized (*Ecofan*)

10-20W demonstrated (*Hi-Z*)

>50 W will be a challenge

>500 W may require ARPA-E level investment

Modules

Commercial Bi_2Te_3-based

- < 250°C special modules (*Hi-Z*)
- < 120°C for Peltier cooler

High, Mid temp modules

- PbTe, H.Heusler, Skutterudite, Silicide, etc.
- evolving. Blog may be helpful

Technical Challenges

Hot side Heat Exchanger

- Thermal Interface to TE module
  - ~200psi pressure and TIM ?
  - **Thermal Interface Resistance**
- Fouling and Corrosion

Cold Side Heat Exchanger

- Passive (no power) or Active (fan)?
- Interface to TE module
  - **Thermal Interface Resistance**
  - ~200psi pressure and TIM grease

Thermal management

- Keep TE at right temperature
  - too small ΔT: no power
  - To high T_{hot}: degrades

Power Management

- Impedance match (transformer)
- Energy storage ?
